

Environmental policy

Nolato Polymer manufactures products in polymer materials that consume energy and raw materials, which directly and indirectly burdens our environment with resource consumption, waste and greenhouse gases.

By actively reducing total energy consumption and use of fossil energy, reducing our scrapping, streamlining material use in the manufacturing process, active recycling of waste and continuous improvement of our environmental management system, we improve our environmental performance.

We are certified against ISO14001:2015, comply with applicable environmental and work environment legislation and the binding requirements of our stakeholders. We do not allow raw materials containing substances according to RoHS, the candidate list in REACH or quantities exceeding the restriction lists of our customers or authorities.
